

## EXECUTIVE SUMMARY

- It is understood the subject project is located at 534 Mandalay Avenue, Clearwater, Pinellas County, Florida and is known as the Clearwater Fire Station No. 46. The property was observed to currently consist of undeveloped property containing grass-surfaced areas and vegetation. This property is located adjacent to the Gulf-of-Mexico. It is understood that this property is within 300 feet of the Coastal Construction Control Line and it has been stipulated that a deep foundation system will be used for structure support.
- This property is expected to be developed with a two-story fire station structure having an elevated fire truck pavement area, and an adjacent stormwater management area. It is anticipated the proposed building will be supported by columns and/or load-bearing walls. The bottom floor of the proposed structure is expected to be constructed as a concrete slab-on-grade. The finished grades of the development area are expected to be elevated approximately nine feet above the existing grade levels. The maximum loadings associated with the proposed structure are expected to be as follows:

Wall Load:	4 kips/linear ft
Column Loads:	180 kips
Floor Load:	100 lbs/sq ft

- The borings indicate the subsurface soils were generally arranged in four soil layers. The initial soil layer encountered generally consisted of approximately seven feet of very loose to medium dense grayish brown fine SAND (SP) with traces of marine shell fragments. The second soil layer encountered generally consisted of very loose to very dense gray fine SAND (SP) with traces of marine shell fragments that extended to an approximate depth of 27 feet below the existing ground surface. The third soil layer encountered generally consisted of very soft to stiff gray CLAY (CH) that extended to an approximate depth of 37 feet below the existing ground surface. The final soil layer generally consisted of hard highly weathered LIMESTONE that extended to the maximum boring termination depths of 54 feet below the existing ground surface elevations. Notable losses of drilling circulation were generally encountered near the limestone interface.
- As recorded immediately after drilling during the time of our subsurface exploration, measurable groundwater was encountered at an approximate depth of five to six feet below the existing ground surface elevations. The normal seasonal high groundwater level (NSHGWL) is expected to be tidally influenced and generally be encountered at least four feet below the existing ground surface elevations.
- Based on the site location and the expected structural characteristics, timber piles are believed to be an attractive deep foundation system to provide support of the proposed structure. Timber piles are expected to attain the following allowable capacities:

<b>Pile Tip Diameter (Inch)</b>	<b>Embedment Depth (Feet)</b>	<b>Compressive Capacity (Tons)</b>	<b>Uplift Capacity (Tons)</b>	<b>Lateral Capacity (Pounds)</b>
8	25	18	4	500
10	25	25	5	800
12	25	30	6	1000

- Two DRI tests were performed at an approximate depth range of two to three feet below the existing ground surfaces. The DRI locations were determined in the field based on ground surface features. The DRI test results indicated the measured vertical infiltration rates ranged from less than 0.1 to 48.3 inches per hour. The porosity of the near-surface soils encountered within the DRI locations is expected to be on the order of 0.28. Following the removal of any near-surface cemented material, the “confining” soil layer is expected to be encountered at least twenty feet below the existing ground surface elevations in the proposed stormwater management area.

Dear Mr. McDowell:

In response to your request, **Gulf Coast Testing Laboratory, Inc. (GCTL)** has conducted a subsurface exploration at the subject site. Please find attached an electronically signed copy of the subsurface exploration report.

**GCTL** appreciates the opportunity to provide Geotechnical Engineering services for this important project. Should you need additional services on this or any other project, **GCTL** offers the expertise of a selected collection of highly experienced, and motivated, Professional Engineers providing Geotechnical Engineering, Environmental Assessment services, as well as Construction Materials Engineering and Testing services.

Please do not hesitate to call should there be any questions about the subsurface exploration. We look forward to the opportunity to work for your organization on this and future projects.

Sincerely,

**GULF COAST TESTING LABORATORY, INC.**

Dear Mr. McDowell:

**Gulf Coast Testing Laboratory, Inc. (GCTL)** has completed the requested geotechnical exploration for the above-referenced project. The results of the subsurface exploration have been evaluated and are presented in this Report of Geotechnical Exploration.

This report presents a review of the project information provided to us, a description of the site and subsurface conditions encountered as well as our foundation and earthwork recommendations. The Appendices to the report contain site and boring location figures, USDA soil survey information, boring logs, site photographs, Double-Ring Infiltration (DRI) Test results, and selected Ground Penetrating Radar (GPR) profiles.

## 1.0 EXECUTIVE SUMMARY

- It is understood the subject project is located at 534 Mandalay Avenue, Clearwater, Pinellas County, Florida and is known as the Clearwater Fire Station No. 46. The property was observed to currently consist of undeveloped property containing grass-surfaced areas and vegetation. This property is located adjacent to the Gulf-of-Mexico. It is understood that this property is within 300 feet of the Coastal Construction Control Line and it has been stipulated that a deep foundation system will be used for structure support.
- This property is expected to be developed with a two-story fire station structure having an elevated fire truck pavement area, and an adjacent stormwater management area. It is anticipated the proposed building will be supported by columns and/or load-bearing walls. The bottom floor of the proposed structure is expected to be constructed as a concrete slab-on-grade. The finished grades of the development area are expected to be elevated approximately nine feet above the existing grade levels. The maximum loadings associated with the proposed structure are expected to be as follows:

Wall Load:	4 kips/linear ft
Column Loads:	180 kips
Floor Load:	100 lbs/sq ft

- The borings indicate the subsurface soils were generally arranged in four soil layers. The initial soil layer encountered generally consisted of approximately seven feet of very loose to medium dense grayish brown fine SAND (SP) with traces of marine shell fragments. The second soil layer encountered generally consisted of very loose to very dense gray fine SAND (SP) with traces of marine shell fragments that extended to an approximate depth of 27 feet below the existing ground surface. The third soil layer encountered generally consisted of very soft to stiff gray CLAY (CH) that extended to an approximate depth of 37 feet below the existing ground surface. The final soil layer generally consisted of hard highly weathered LIMESTONE that extended to the maximum boring termination depths of 54 feet below the existing ground surface elevations. Notable losses of drilling circulation were generally encountered near the limestone interface.
- As recorded immediately after drilling during the time of our subsurface exploration, measurable groundwater was encountered at an approximate depth of five to six feet below the existing ground surface elevations. The normal seasonal high groundwater level (NSHGWL) is expected to be tidally influenced and generally be encountered at least four feet below the existing ground surface elevations.
- Based on the site location and the expected structural characteristics, timber piles are believed to be an attractive deep foundation system to provide support of the proposed structure. Timber piles are expected to attain the following allowable capacities:

Pile Tip Diameter (Inch)	Embedment Depth (Feet)	Compressive Capacity (Tons)	Uplift Capacity (Tons)	Lateral Capacity (Pounds)
8	25	18	4	500
10	25	25	5	800
12	25	30	6	1000

- Two DRI tests were performed at an approximate depth range of two to three feet below the existing ground surfaces. The DRI locations were determined in the field based on ground surface features. The DRI test results indicated the measured vertical infiltration rates ranged from less than 0.1 to 48.3 inches per hour. The porosity of the near-surface soils encountered within the DRI locations is expected to be on the order of 0.28. Following the removal of any near-surface cemented material, the “confining” soil layer is expected to be encountered at least twenty feet below the existing ground surface elevations in the proposed stormwater management area.

## 2.0 INTRODUCTION

### 2.1 PROJECT CHARACTERISTICS

This property is expected to be developed with a two-story fire station structure having an elevated fire truck pavement area, and an adjacent stormwater management area. It is anticipated the proposed building will be supported by columns and/or load-bearing walls. The bottom floor of the proposed structure is expected to be

constructed as a concrete slab-on-grade. The finished grades of the development area are expected to be elevated approximately nine feet above the existing grade levels (see illustration).

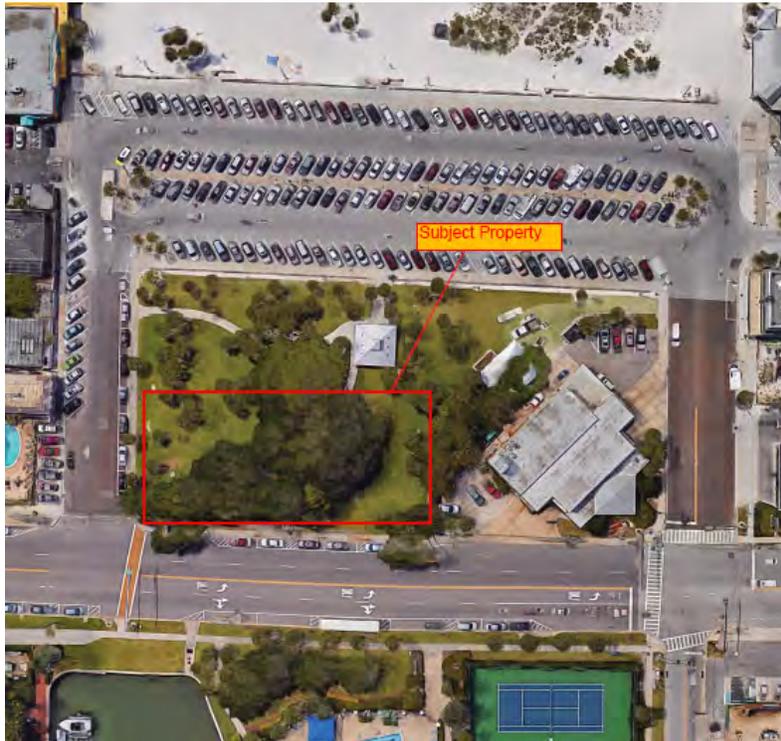

It is understood the maximum structural loadings are expected to be as follows:

Wall Load:	3 kips/linear ft
Column Loads:	180 kips
Floor Load:	100 lbs/sq ft

## 2.2 SITE DESCRIPTION

It is understood the subject project is located at 534 Mandalay Avenue, Clearwater, Pinellas County, Florida and is known as the Clearwater Fire Station No. 46.

The property was observed to currently consist of undeveloped property containing grass-surfaced areas and vegetation. This property is located adjacent to the Gulf-of-Mexico (see photograph).

It is understood that this property is within 300 feet of the Coastal Construction Control Line and it has been stipulated that a deep foundation system will be used for structure support.

The approximate site location is illustrated on Figures in the Appendix of this report. Photographs of the subject property have been included in the Appendix of this report.

## 2.3 PURPOSE AND SCOPE

The purpose of this study was to obtain information on the general subsurface conditions at the proposed project site. The subsurface materials encountered were then evaluated with respect to the available project characteristics. In this regard, engineering assessments for the following items were formulated:

- General location and description of potentially deleterious materials encountered in the borings, which may interfere with construction progress or structure performance, including existing fills or surficial/subsurface organics.
- Identification of the existing groundwater levels and estimated normal seasonal high groundwater fluctuations.
- Evaluate a ground penetrating radar (GPR) survey for the purpose of determining the lateral extent of subsurface soils and sediments at the proposed site. Isolated discontinuities in the subsurface materials may be evaluated to represent sites where karst erosion might have occurred during the geologic past.
- Identification of possible subsurface utilities, structures, and/or obstructions within the immediate area of the proposed project.
- Evaluate a GPR survey for the purpose of determining the location of underground utilities and/or structures.
- Evaluate active raveling (“sinkhole-type”) activity, if any, in the borings performed.
- Evaluation of an appropriate foundation system to be used for support of the proposed structure, with a slab-on-grade floor member. Identification of recommended foundation design parameters, including allowable bearing pressures, foundation levels and expected total and differential settlements.
- Pavement design and construction suggestions, considering the encountered subgrade soils and the measured groundwater conditions. Development of the vertical modulus of subgrade reaction.
- Determination of the vertical infiltration characteristics of the upper soils in the designated areas.
- Recommended soil subgrade preparation operations, including stripping, grubbing and compaction. Recommended engineering criteria for placement and compaction of approved structural fill materials.
- Evaluation of the suitability and availability of materials on-site that may be moved during site grading for use as structural fill in the building area, as pavement subgrade fill, and as general backfill.
- Presentation of construction recommendations, including expected ground water control measures, temporary slope stability recommendations, and unsuitable soil removal guidelines.

The following services were provided in order to achieve the preceding objectives:

- Reviewed readily-available published geologic information. This included information from available soil survey information published by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS).
- Reviewed readily-available aerial photographs of the subject property obtained from Google Earth Pro and the Florida Department of Transportation (FDOT).
- Coordinate underground utility location services through Sunshine State One Call of Florida, Inc.
- Performed two Double Ring Infiltration (DRI) tests in general accordance with the American Society of Testing and Materials (ASTM) test designation D-3385.
- Perform a deep Ground Penetrating Radar (GPR) survey for the purpose of determining the lateral extent of subsurface soils and sediments at the proposed site.
- Perform a Quality Level A Subsurface Utility Engineering (SUE) survey within the immediate area of the subject project. This includes:
  - A shallow GPR survey for the purpose of determining possible shallow utilities and/or subsurface structures/obstructions at the proposed site.
  - Physically locate identified shallow subsurface utilities/structures/obstructions by manual augering.
  - Perform a maximum of one day of on-site surveying in order to establish the top of utility horizontally and vertically.
- Executed a program of subsurface exploration consisting of subsurface sampling and field testing.
  - Performed a total of five SPT borings within the designated development area. The SPT borings extended to maximum depth of 54 feet below the existing ground surface elevations. Steel casing to maintain drilling fluid circulation was required to maintain borehole integrity. The deep boreholes were grout/bentonite sealed.
  - Performed nine auger borings within the development area. The auger borings extended to maximum depths of ten feet below the existing ground surface elevations. The shallow boreholes were backfilled with on-site soils.
  - Containerize and dispose of excess drilling fluid and soil cuttings off-site.

- Visually classified and stratified representative soil samples in the laboratory using the Unified Soil Classification System (USCS). Identified soil conditions at each boring location and formed an opinion of the site soil stratigraphy.
- Collected groundwater level measurements and estimated normal wet seasonal high groundwater levels.
- The results of the field exploration and laboratory tests were used in the engineering analyses and in the formulation of the recommendations. The results of the subsurface exploration, including the recommendations and the data upon which they are based, are presented in this formal written report prepared by an experienced Professional Engineer.

The scope of our services does not include a thorough environmental assessment or investigation for the presence or absence of hazardous or toxic materials in the soil, groundwater, or surface water within or beyond the site studied.

### 3.0 FIELD EXPLORATION

The general foundation soil types and associated design parameters were developed by drilling a total of five soil test borings and nine auger borings within the proposed development area. It is important to note that the original scope of services predicated three soil test borings were to be performed, however, based on the soil test results, two additional soil test borings were included in the scope of services and the borings were required to use steel casing and be extended to additional depths.

The boring locations were determined in the field from existing ground surface features. The ground surface elevations at the boring locations were neither furnished nor determined. The boring locations illustrated in the Appendix should be considered accurate only to the degree implied by the method used. If more precise locations are desired, we suggest that you contact a Registered Surveyor. The approximate locations of the borings are illustrated in the Appendix of this report.

The soil test borings were advanced with a track-mounted drill rig using “Mud” Rotary drilling procedures to approximate maximum depths of 54 feet below the existing ground surface elevations (see photograph). It is noted the steel casing was utilized and soil boring depths were extended due to the very loose soil conditions and drilling circulation loss conditions encountered.

The soil sampling was performed in general accordance with ASTM Test Designation D-1586, entitled "Penetration Test and Split-Barrel Sampling of Soils." Samples were obtained at intervals of two feet to a depth of ten feet, and at intervals of five feet thereafter. Representative portions of these soil samples were sealed in “air-tight” containers, labeled and transferred to our laboratory for classification and testing.

The auger borings were performed with the track-mounted drill rig with the use of a solid-stem steel auger and/or manually performed with the use of a 3-inch nominal diameter solid stem bucket auger. The soil sampling was performed in general accordance with ASTM Test Designation D-1452, titled "Soil Investigation and Sampling by Auger Borings." These samples were taken "continuously" from the ground surface to an approximate maximum depth of ten feet below the existing ground surface elevations. Representative portions of these soil samples were sealed in "air-tight" containers, labeled and transferred to our laboratory for classification and testing.

### 3.1 DOUBLE RING INFILTRATION (DRI) TESTS

Two DRI tests were performed following ground saturation in general accordance with ASTM Test Designation D-3385, titled "Infiltration Rate of Soils in Field Using Double-Ring Infiltrimeters" (see photograph).

The DRI test results have been tabulated and are presented below:

DRI Test Number	Depth* (Feet)	Near-Surface Porosity (Percent)	Measured Vertical Infiltration Rate (In/Hr)	"Confining" Soil Depth* (Feet)	Estimated Seasonal High Groundwater Depth* (Feet)
1	2.0	20	<0.1	>20	4.0
2	3.0	30	48.3	>20	4.0

\*Depth below existing ground surface elevations following the removal of any near-surface cemented material

The DRI test results have been provided in the Appendix of this report.

### **3.2 GROUND PENETRATING RADAR SURVEY**

Two Ground Penetrating Radar (GPR) surveys were performed across the accessible portions of the property in general accordance with the ASTM D 6432 publication entitled, “Standard Guide for Using the Surface Penetrating Radar Method for Sub-surface Investigation” to explore the shallow soil conditions. The second GPR survey performed for the purpose of determining possible shallow utilities and/or subsurface structures/obstructions at the proposed site. The results of the second GPR survey has been provided as a separate report.

GPR is a geophysical technique that is used to image subsurface anomalies and/or variations in the shallow soil profile. Subsurface features that can be identified with GPR may include natural variations in stratigraphy and unnatural features such as underground utilities, drain fields, buried debris, petroleum contamination, backfilled trenches, and disturbed soils.

The GPR antenna transmits short-duration electromagnetic waves into the ground with the profiling recorder digitally processing the reflected signals and continuously recording a graphic representation of the soil profile. The reflected signals vary in intensity, depending on the soil strata encountered.

The GPR unit used for this report was manufactured by Mala Geoscience, Inc. of Sweden. The X3M RAMAC system consists of a profile recorder unit that is connected to a 100, 250 and/or 500-megahertz (MHz) shielded antenna by a control cable. The monitor provides for real-time or playback viewing of the data, which is saved on the internal hard drive. Interpretation of the data is performed using Reflex and/or GroundVision software packages.

#### **Horizontal Scaling**

The locations of the GPR transects were spaced where applicable. The spacing was executed to allow for a degree of coverage of the survey area for the intended target.

## Data Collection

GPR transect lines were positioned in the field from a point of reference with measurements by fiberglass tape or survey wheel. Data is collected along these paths and a subsurface profile is produced. The transect lines were located at an approximate spacing of ten feet. Transects were assigned specific numbers to indicate the line and direction of data collection.

## Geophysical Analysis

Based on the intended geophysical target, the characteristics of the selected antenna are tabulated below.

Antenna Frequency (Mega Hertz)	Time Range (Nanoseconds)	Effective Depth of Penetration (Nanoseconds)	Maximum Depth GPR Signal (Feet)
250	120	48	20

The GPR profiles were orientated from west to east and north to south directions. The GPR signal extended to an approximate depth of 20 feet below the existing ground surface, after which some attenuation of GPR signal occurred. The depth of penetration of the radar signal is based on factors such as the location of the water table, depth to clay layers, and signal attenuation.

The geophysical data was generally consistent across transects that were performed at the subject property. The GPR survey with the 250 Mhz antenna did not indicate geophysical anomalies that would be considered consistent with deeper geologic conditions, such as sinkhole activity.

Copies of selected GPR profiles attained at the subject property have been included in the Appendix of this report.

#### **4.0 LABORATORY TESTING**

The soil samples were transported to our laboratory and were classified by the Geotechnical Engineer using the Unified Soil Classification System (USCS) in general accordance with ASTM Test Designation D-2488. Based on the subsurface materials encountered with respect to the proposed project, refined laboratory testing was not deemed necessary.

It should be noted that all soil samples will be properly disposed of 30 days following the submittal of the **GCTL** subsurface exploration report.

## 5.0 GENERALIZED SUBSURFACE CONDITIONS

### 5.1 AERIAL PHOTOGRAPH

The Aerial Photographs dated 2019, 2015, 2007, 2002, 1995, 1986, 1980, 1975, 1970, and 1962 were reviewed for the subject property. Based on this review, the aerial photographs appeared to illustrate the subject property to be similar to the conditions observed during the time of our field services. An elevated water storage structure does appear to be located northwest of the subject property in the aerial photographs dated from 1995 through 1962. Copies of the aerial photographs have been included in the Appendix of this report.

### 5.2 COUNTY SOIL SURVEY

The “Soil Survey of Pinellas County, Florida”, published by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS), was reviewed for general near-surface soil information within the general vicinity of the subject project. This information indicates that there are two primary soil mapping units within the proposed project area. The soil map unit characteristics are tabulated below:

SOIL SERIES	DEPTH (INCHES)	UNIFIED SOIL CLASS	PERMEABILITY RATING (INCHES/HOUR)	USDA SEASONAL HIGH GROUNDWATER TABLE	
				DEPTH (FEET)	MONTHS
Matlacha and St. Augustine Soils and Urban Land (16)	0 – 42	SP, SP-SM	2.0 – 6.0	2.0 – 3.0	June-October
	42 – 80	SP, SP-SM	6.0 – 20.0		
	0 – 22		6.0 – 20.0	1.5 – 3.0	
	22 – 33		2.0 – 20.0		
	33 – 48	SP, SP-SM	6.0 – 20.0		
	48 – 63	SM, SP-SM	2.0 – 20.0		
63 – 80		6.0 – 20.0			

A copy of the soil survey map has been included in the Appendix of this report.

### **5.3 MAPPED SINKHOLES OF PINELLAS COUNTY**

The illustration entitled “Sinkholes of Pinellas County, Florida, 2008”, published by Florida Center for Instructional Technology, was reviewed for the subject property. Based on this review, the subject property does not appear to have a mapped sinkhole. In addition, mapped sinkholes do appear within the immediate vicinity of the subject property. A copy of the referenced illustration has been included in the Appendix of this report.

### **5.4 SEISMIC SITE CLASSIFICATION**

Based on our review of the International Building Code, dated 2006, and our knowledge of the general subsurface conditions at the site, we believe the site should be considered to be a Site Class D. It should be noted that this classification is based on the subsurface exploration results and our experience in the area. A soil test boring extending to a depth of at least 100 feet may be performed to verify this site classification.

### **5.5 SUBSURFACE CONDITIONS**

Soil stratification was based on visual observation of the recovered soil samples, laboratory testing and interpretation of the field boring logs by an experienced GCTL Engineering Technician. The boring stratification lines represent the approximate boundaries between soil types of significantly different engineering properties; however, the actual transition may be gradual. In some cases, small variations in properties not considered pertinent to our engineering evaluation may have been abbreviated or omitted for clarity. The boring profiles present the conditions at the particular boring location and variations do occur among the borings and between soil samples. The borings indicate the subsurface soils were generally arranged in four soil layers.

The initial soil layer encountered generally consisted of approximately seven feet of very loose to medium dense grayish brown fine SAND (SP) with traces of marine shell fragments. Standard Penetration Test (SPT) results within this soil stratum were measured to range from 2 to 13 blows per foot (bpf).

The second soil layer encountered generally consisted of very loose to very dense gray fine SAND (SP) with traces of marine shell fragments that extended to an approximate depth of 27 feet below the existing ground surface. SPT results within this soil stratum were measured to range from 2 to 55 bpf.

The third soil layer encountered generally consisted of very soft to stiff gray CLAY (CH) that extended to an approximate depth of 37 feet below the existing ground surface. SPT results within this soil stratum were measured to range from Weight-of-Rod (WR) for a depth of five feet to 13 bpf.

The final soil layer generally consisted of hard highly weathered LIMESTONE that extended to the maximum boring termination depths of 54 feet below the existing ground surface elevations. Notable losses of drilling circulation were generally encountered near the limestone interface. SPT results within this soil stratum were measured to range from 20 bpf to 50 blows per zero inches of penetration.

The subsurface exploration indicated the subsurface material was generally consistent across the subject property. It is notable that Weight of Rod (WR) material was encountered in boring B-2 at an approximate depth range of 38 to 47 feet below the existing ground surface elevations. In addition, circulation losses were encountered in borings B-1, B-2, and B-4 near and within the highly weathered LIMESTONE during the subsurface exploration. Based on our extensive experience with similar subsurface conditions, the conditions encountered are not believed to represent conditions indicative of sinkhole type activity.

## **5.6 GROUNDWATER CONDITIONS**

As recorded immediately after drilling during the time of our subsurface exploration, measurable groundwater was encountered at an approximate depth of five to six feet below the existing ground surface elevations.

Groundwater levels tend to fluctuate during periods of prolonged drought and extended rainfall and may be affected by man-made influences. In addition, a seasonal effect may also occur during which higher groundwater levels are normally recorded in rainy seasons. Based on our review of the subsurface conditions, including the soil coloring characteristics, available published information, and the reported rainfall events, the normal seasonal high groundwater level (NSHGWL) is expected to generally be encountered at least four feet below the existing ground surface elevations.

If the ground water level is critical to design or construction, ground water observation wells should be installed on-site to monitor ground water fluctuations over a period of time and to permit more accurate determinations of wet season and dry season levels.

## **6.0 DESIGN RECOMMENDATIONS**

The following design recommendations have been developed on the basis of the previously described project characteristics and subsurface conditions encountered during this exploration. The test boring data was evaluated utilizing correlations between the measured standard penetration test resistances and the engineering performance characteristics of similar subsurface conditions. Once the final building characteristics have been identified, including project building locations on the site, and structural loading conditions, a review must be made by **GCTL** to determine if any modifications to the recommendations will be required.

### **6.1 GENERAL**

Based on our review of the GPR results, the GPR survey with the 250 Mhz antenna did not indicate geophysical anomalies that would be considered consistent with deeper geologic conditions, such as sinkhole activity. Although circulation losses and Weight of Rod (WR) material was encountered near and within the highly weathered LIMESTONE during the subsurface exploration, based on our extensive experience with similar subsurface conditions, the conditions encountered are not believed to represent conditions indicative of sinkhole type activity.

It is understood that this property is within 300 feet of the Coastal Construction Control Line and it has been stipulated that a deep foundation system will be used for structure support. Due to the circulation losses encountered during the subsurface exploration, auger cast-in-place piles may experience significant grout losses; in this regard, auger cast-in-place piles are not considered an attractive foundation alternative. Based on our extensive experience with similar subsurface conditions, timber piles tend to be a cost-effective foundation system and are believed to be an attractive deep foundation system to provide support of the proposed structure.

Following clearing and grading, the exposed ground surface should be proofrolled and compacted with a vibratory drum roller having a static drum weight on the order of eight tons (such as Caterpillar CS44B or approved equivalent) under the direction of an experienced Professional Engineer in order to confirm the ability of the soils to properly support the expected development. It is recommended that twelve passes of the roller be performed, with successive passes aligned perpendicular to the proceeding pass. Areas which are evaluated to be unstable, if any, should be remediated in accordance with the recommendations of the Geotechnical Engineer. Care should be used in areas in which the vibratory roller is within 50 feet of existing structures in order to prevent vibrations which could be detrimental to existing structures.

## 6.2 TIMBER PILES

Timber piles have the advantages of being easy to handle, easy to cut off, relatively inexpensive, readily available and naturally tapered. They have the disadvantages of decaying above the water table (if not treated), having low capacities, being prone to damage by hard driving and being difficult to splice. It is noted that timber pile driving operations may create vibrations that could cause settlement damage, cracking or disturb occupants of nearby residences.

Driven piles have the advantage that the installation procedure provides a means to confirm pile capacity, by monitoring blow counts, and does not produce excessive debris in the form of auger cuttings or concrete spills. Installation of driven piles does, however, produce significant noise and vibration levels that may affect adjacent structures. In order to reduce the transmission of vibrations, and assist in obtaining minimum embedment depths, predrilling to depths ranging from five to fifteen feet below the existing ground surface elevations may become necessary and vibration monitoring should be provided.

### 6.2.1 Compressive and Uplift Capacities

The allowable axial capacities for timber piles having 8, 10, and 12-inch tip diameters have been evaluated using the computer program FB-Deep (version 2.05) developed by the Florida Bridge Software Institute (FBSI), and our extensive experience with similar conditions. In this regard, the compressive and uplift capacities of the piles are tabulated below.

<b>Pile Tip Diameter (Inch)</b>	<b>Estimated Embedment Depth (Feet)</b>	<b>Compressive Capacity (Tons)</b>	<b>Uplift Capacity (Tons)</b>
8	25	18	4
10	25	25	5
12	25	30	6

The uplift and lateral capacities of the piles are based on achieving a minimum embedment length of 18 feet below the existing ground surface. The static pile bearing capacity analysis using the FBSI design program FB-Deep has been attached in the Appendix of this report.

### 6.2.2 Lateral Capacity

The lateral deflection of a single pile under working load conditions has been determined for timber piles having 8, 10, and 12-inch tip diameters, respectively. The analyses were conducted using the computer program (LPILE) developed by Ensoft, Inc. The program uses a finite difference technique to model pile behavior under lateral loads, axial loads and moments applied at the pile head. In performing the analyses, the following information was utilized in the computer program LPILE developed by Reese (1984).

Area (In <sup>2</sup> )	50, 78, and 113
Timber Compressive Strength (psi)	1200
Minimum Pile Length (Ft.)	18
Distance From Top of Pile to Ground Surface (Ft.)	1
Loading Condition	Static free-head

Lateral capacity analyses for the timber pile were performed by applying the load cases to the minimum pile length. The results of the analyses have been included in the Appendix of this report, with a summary tabulated below.

Lateral Stability Analysis 8-Inch Diameter Timber Piles				
Pile Tip Diameter (In)	Axial Load (Tons)	Lateral Load (pounds)	Pile Head Deflection (In.)	Maximum Moment (In-K)
8	20	400	0.08	12.3
		600	0.12	18.6
		800	0.17	25.6
		1000	0.24	33.6

Lateral Stability Analysis 10-Inch Diameter Timber Piles				
Pile Tip Diameter (In)	Axial Load (Tons)	Lateral Load (pounds)	Pile Head Deflection (In.)	Maximum Moment (In-K)
10	25	1500	0.17	50.1
		2000	0.24	69.8
		2200	0.29	78.8
		2400	0.37	88.5

Lateral Stability Analysis 12-Inch Diameter Timber Piles				
Pile Tip Diameter (In)	Axial Load (Tons)	Lateral Load (pounds)	Pile Head Deflection (In.)	Maximum Moment (In-K)
12	30	3000	0.22	110.1
		3500	0.29	132.2
		3800	0.35	146.7
		4000	0.42	157.0

### **6.2.3 Settlement**

Settlement is expected to primarily consist of elastic shortening of the pile material and associated settlement required to mobilize resistance. Total settlement at these capacities is expected to be on the order of ½ inch with differential settlement of ¼ inch.

### **6.2.4 Pile Characteristics**

It is recommended that the timber piles meet the requirements of ASTM D-25 for round timber tip bearing piles. The pile should be clean peeled and pressure treated in accordance with the requirements of the American Wood Protection Association (AWPA) Use Category 4C and the current Florida Building Code. In this regard, we recommend the timber piles be treated with CCA (Chromated copper arsenate) due to the location of the proposed structure in a temperature zone coastal environment.

The timer pile design stresses should be established in accordance with ASTM D-2899 and the Florida Building Code. Prior to driving, it is recommended that timber piles be relatively free of defects and have a water content greater than approximately 20 percent (to minimize breaking) and less than about 50 percent (to minimize "brooming").

### **6.2.5 Pile Installation**

The timber piles are expected to achieve satisfactory capacities at an approximate embedment depth of 25 feet below the expected finished ground surface elevations: these piles should be installed to minimum embedment depths of 18 feet below the expected finished ground surface. Piling lengths should be expected to vary on the order five feet from the expected pile length.

Predrilling to depths ranging from five to fifteen feet below the existing ground surface elevations may become necessary; the least necessary predrilling should be performed to achieve the intent of the installation recommendations. The piles should then be driven to the dynamic driving resistance as determined by an acceptable pile driving formula, such as ENR or WEAP methods, or to practical refusal, whichever comes first. It is essential that driving be terminated immediately if "refusal" is reached to prevent damage to the piles. The pile driving hammer should have a rated energy on the order of 30,000 foot-pounds per blow.

In order to minimize driving difficulties due to densification of the soils and the reduction in capacity due to group action of the piles, it is recommended that the piles be driven with a center-to-center spacing of at least three feet.

A Pre-Construction meeting with the Owner/Owner's representative, Structural Engineer, Geotechnical Engineer, Contractor and Piling Contractor should be held on-site, prior to initializing pile driving operations. The installation of all deep foundation systems should be in accordance with the Florida Building Code requirements. In addition, the installation of all piles should be monitored by an experienced **GCTL** Professional Engineer or his representative. The Engineer should verify and record all aspects of the installation. In general, the Engineer or his representative should:

1. Be familiar with all aspects of the installation.
2. Be present continuously during driving.
3. Record and approve the dimensions of each pile, locate and report any obvious defects.
4. Count and record the blows for each foot of driving.
5. Record the energy rating of hammer and adjust where appropriate for chamber pressure.
6. Have knowledge of soil conditions at the site and the minimum required penetration of each pile.
7. Be cognizant of intended support mechanisms of piles on which to base approval or rejection or pre-drilling, etc.
8. Have authority to stop pile driving when unanticipated difficulties or conditions are encountered.

#### **6.2.6 Pile Load Test Program**

Based on the conservativeness provided in the foundation recommendations, pile load testing is not considered to be necessary. However, should unusual pile installation be encountered, at least one pile may be tested to two times the allowable compression design capacity. The compression load test should be performed in general accordance with ASTM Standard D 1143 and under the direct supervision of a geotechnical engineer; the Quick Loading Procedure is recommended for performing the compression tests.

## 7.0 FLOOR SLAB

It is expected that the floor slabs may be safely supported as slab-on-grade members provided that any undesirable materials are removed and replaced with controlled structural fill. It is also recommended that the floor slab bearing soils be covered by a lapped polyethylene sheeting of in order to reduce the potential for floor dampness which can affect the performance of glued tile and carpet, if any are used.

This membrane should consist of a 10-mil single layer of non-corroding, non-deteriorating polyethylene sheeting material placed so as to minimize seams and to cover all of the soil below the building floor slab. This membrane should be cut in a “cross shape” to allow for pipes or other penetrations and the membrane should extend to within ½ inch of all such pipes or penetrations. All seams of the membrane should be lapped at least 12 inches. Punctures or tears in the membrane should be repaired with the same or comparable material and sealed in a waterproof manner.

The performance of concrete floor slabs is also affected by the concrete mix that is used. A relatively high water-cement ratio of the mix can cause aesthetic disruptions, such as unsightly slab “curling” and shrinkage cracking. Also, an additional waiting period may be required prior to installing moisture-sensitive floor covering because of the moisture loss from the concrete floor slabs.

## **8.0 PAVEMENT THICKNESS DESIGN CONSIDERATIONS**

It is understood that a rigid (Portland Cement) pavement section is to be utilized within the proposed pavement areas. The following pavement recommendations presented in the following sections are considered minimum for the site, soil and limited traffic conditions expected. The final pavement thickness design should be determined by the project civil engineer using information obtained during the subsurface exploration program and an analysis of anticipated traffic conditions.

### **8.1 SUBGRADE**

The borings indicate the subsurface soils generally consisted of very loose to medium dense fine SAND (SP) with traces of marine shell fragments. Based upon our evaluation and analyses, the subgrade soils should be acceptable for construction and support of a rigid type pavement section after proper subgrade preparation, provided that drainage controls are implemented.

The existing surface soils should be proofrolled with a vibratory drum roller having a static drum weight on the order of eight tons (such as Caterpillar CS44B or approved equivalent) under the direction of a Geotechnical Engineer in order to confirm the ability of the soils to properly support the expected building development. Following approval of the Geotechnical Engineer, the pavement subgrade should be compacted to a minimum depth of 12 inches to at least 98 percent of the Modified Proctor maximum dry density (ASTM D1557). Any fill used to elevate the cleared pavement areas to subgrade elevation should consist of reasonably clean well-graded to fine sands, uniformly compacted to a minimum density of 98 percent of the soil Modified Proctor maximum dry density (ASTM D1557).

### **8.2 MODULUS OF SUBGRADE REACTION**

Based upon the soil conditions encountered at the proposed site and the recommended site preparation operations presented in the Construction Considerations section of this report, the modulus of vertical subgrade reaction (k) for the shallow soil is expected to be on the order of 300 pounds per square inch per inch of vertical deflection (pci).

### 8.3 RIGID CONCRETE PAVEMENT

The following pavement thickness designs are based upon the design procedure described in the American Association of State Highway and Transportation Officials (AASHTO) publication titled “Design of Pavement Structures” (dated 1993). This design method considers the following pavement characteristics:

- The concrete has a minimum flexural strength of 470 psi.
- Continuously reinforced concrete pavement
- Excellent drainage
- Design serviceability loss of 2.5
- Reliability of 95% with an overall standard deviation of .35

Based upon our experience, it is recommended a minimum thickness of seven inches should be utilized for heavy duty applications, such as fire truck access. It is further recommended that a reinforcing steel mat, preferably size No. 3 steel bars, be placed sixteen inches on center. However, the steel reinforcement within the concrete pavement should be designed by the project Civil Engineer.

The following table summarizes the results of our rigid pavement evaluation for “light duty”, “medium duty”, and “heavy duty” pavement sections.

<b>Pavement Duty</b>	<b>Pavement Structural Section</b>		<b>Subgrade Support</b>	<b>Modulus of Rupture</b>	<b>Estimated Total 18-kip Equivalent Single Axel (ESAL) Load Applications</b>
Light	5" Concrete	12" Compacted Subgrade	High	470	200,000
Medium	6" Concrete	12" Compacted Subgrade	High	470	450,000
Heavy	7" Concrete	12" Compacted Subgrade	High	470	1,000,000

## 9.0 CONSTRUCTION CONSIDERATIONS

### 9.1 FILL PLACEMENT AND SUBGRADE PREPARATION

The following are our recommendations for overall site preparation and mechanical densification work for construction of the proposed development, based on the anticipated construction and our boring results. These recommendations should be used as a guideline for the project general specifications prepared by the Design Engineer.

1. The location of any existing underground utility lines within the construction area should be established. Provision should then be made to relocate any interfering utility lines from the construction area to appropriate locations. In this regard, it should be noted that if underground pipes are not properly removed or plugged, they may serve as conduits for subsurface erosion which subsequently may result in excessive settlements.
2. Following clearing and grading, the exposed ground surface should be proofrolled and compacted with a vibratory drum roller under the direction of an experienced Professional Engineer in order to confirm the ability of the soils to properly support the expected development on shallow foundations. It is recommended the roller have a static drum weight on the order of eight tons (such as Caterpillar CS44B or approved equivalent). Careful observations should be made during proofrolling to help identify any areas of soft yielding soils that may require over-excavation and replacement.
3. It is recommended that the natural ground be compacted to a dry density of at least 95 percent of the Modified Proctor Test maximum dry density (ASTM D-1557) to a minimum depth of one foot below the stripped grade within the building floor slab area.
4. It is recommended that the natural ground be compacted to a dry density of at least 98 percent of the Modified Proctor Test maximum dry density to a minimum depth of one foot below stripped grade within the pavement areas.
5. Following satisfactory completion of the proofrolling and compaction operations, the proposed structure area may be brought up to finished subgrade levels, if required. It is recommended that off-site fill consist of soils having less than eight percent passing the No. 200 sieve, and be free of rubble, organics, clay, debris and other unsuitable material. Fill should be tested and approved by **GCTL** prior to acquisition. Approved sand fill should be placed in loose lifts not exceeding twelve inches in thickness. The fill soils should be compacted to a dry density of at least 95 percent of the Modified Proctor Test maximum dry density within the building areas and 98 percent of the Modified Proctor Test maximum dry density within the pavement areas.

6. Soil moisture content may need to be controlled in order to facilitate proper compaction. If additional moisture is necessary to achieve the compaction objectives of imported fill, then water should be applied in such a way that will not cause erosion or removal of the subgrade soils. A moisture content within two percentage points of the optimum indicated by the Modified Proctor Test (ASTM D-1557) is recommended prior to compaction of the natural ground and fill.
7. It is recommended that all foundation excavations be observed by the Geotechnical Engineer. Foundation bearing soils approved by the Geotechnical Engineer as load bearing materials should be compacted to develop a minimum density requirement of 95 percent of the maximum Modified Proctor dry density with ASTM D-1557, for a minimum depth of one foot below the bottom of the footing depths. Soils placed adjacent to footings or walls should be carefully compacted with a light rubber-tired roller or vibratory plate compactor to avoid damaging the footings or walls.
8. A representative from **GCTL** should be retained to provide on-site observation of earthwork and ground modification activities. It is important that **GCTL** be retained to observe that the subsurface conditions are as we have discussed and reported herein, and that foundation construction, ground modification and fill placement are in accordance with our recommendations.

## 9.2 GROUNDWATER CONTROL

Measurable groundwater was encountered at an approximate depth of five to six feet below the existing ground surface elevations. Groundwater levels tend to fluctuate during periods of prolonged drought and extended rainfall and may be affected by man-made influences. The normal seasonal high groundwater level (NSHGWL) is expected to generally be encountered at least four feet below the existing ground surface elevations.

Soils exposed in the bases of all satisfactory foundation excavations should be protected against any detrimental change in conditions, such as physical disturbance or rain water. Surface runoff water should be drained away from the excavations and not be allowed to pond. If possible, all foundation concrete should be placed the same day that the excavations are made. If this is not possible, the foundation excavations should be adequately protected in the interim.

### **9.3 TEMPORARY SIDE SLOPES**

The side slopes for temporary excavations are expected to remain stable at two horizontal to one vertical (2H:1V) to a maximum excavation depth of six feet. Where restrictions do not permit slopes to be constructed as recommended above, the excavation should be shored and braced in accordance with current OSHA requirements. Excavated materials should not be stockpiled at the top of any slope within a horizontal distance equal to the excavation depth.

### **9.4 ON-SITE SOIL SUITABILITY**

All materials to be used for backfill or compacted fill construction should be evaluated and, if necessary, tested by **GCTL** prior to placement to determine if they are suitable for the intended use. In general, the near surface soil strata are expected to consist of fine SAND that tends to be moderately moisture sensitive. In this regard, the near-surface soils are expected to be **SUITABLE** for use as structural fill. Partially cemented soils tend to be moisture sensitive and are expected to be generally **UNSUITABLE** for use as structural fill.

It is recommended that off-site structural fill materials consist of soils having less than eight percent passing the No. 200 sieve, and be free of rubble, organics, clay, debris and other unsuitable material. Any off-site materials used as fill should be approved by an experienced Professional Engineer prior to acquisition.

## 10.0 BASIS FOR RECOMMENDATIONS

Our professional services have been performed, our findings obtained and our recommendations prepared in accordance with generally accepted geotechnical engineering principles and practices. This company is not responsible for the conclusions, opinions or recommendations made by others based upon this data.

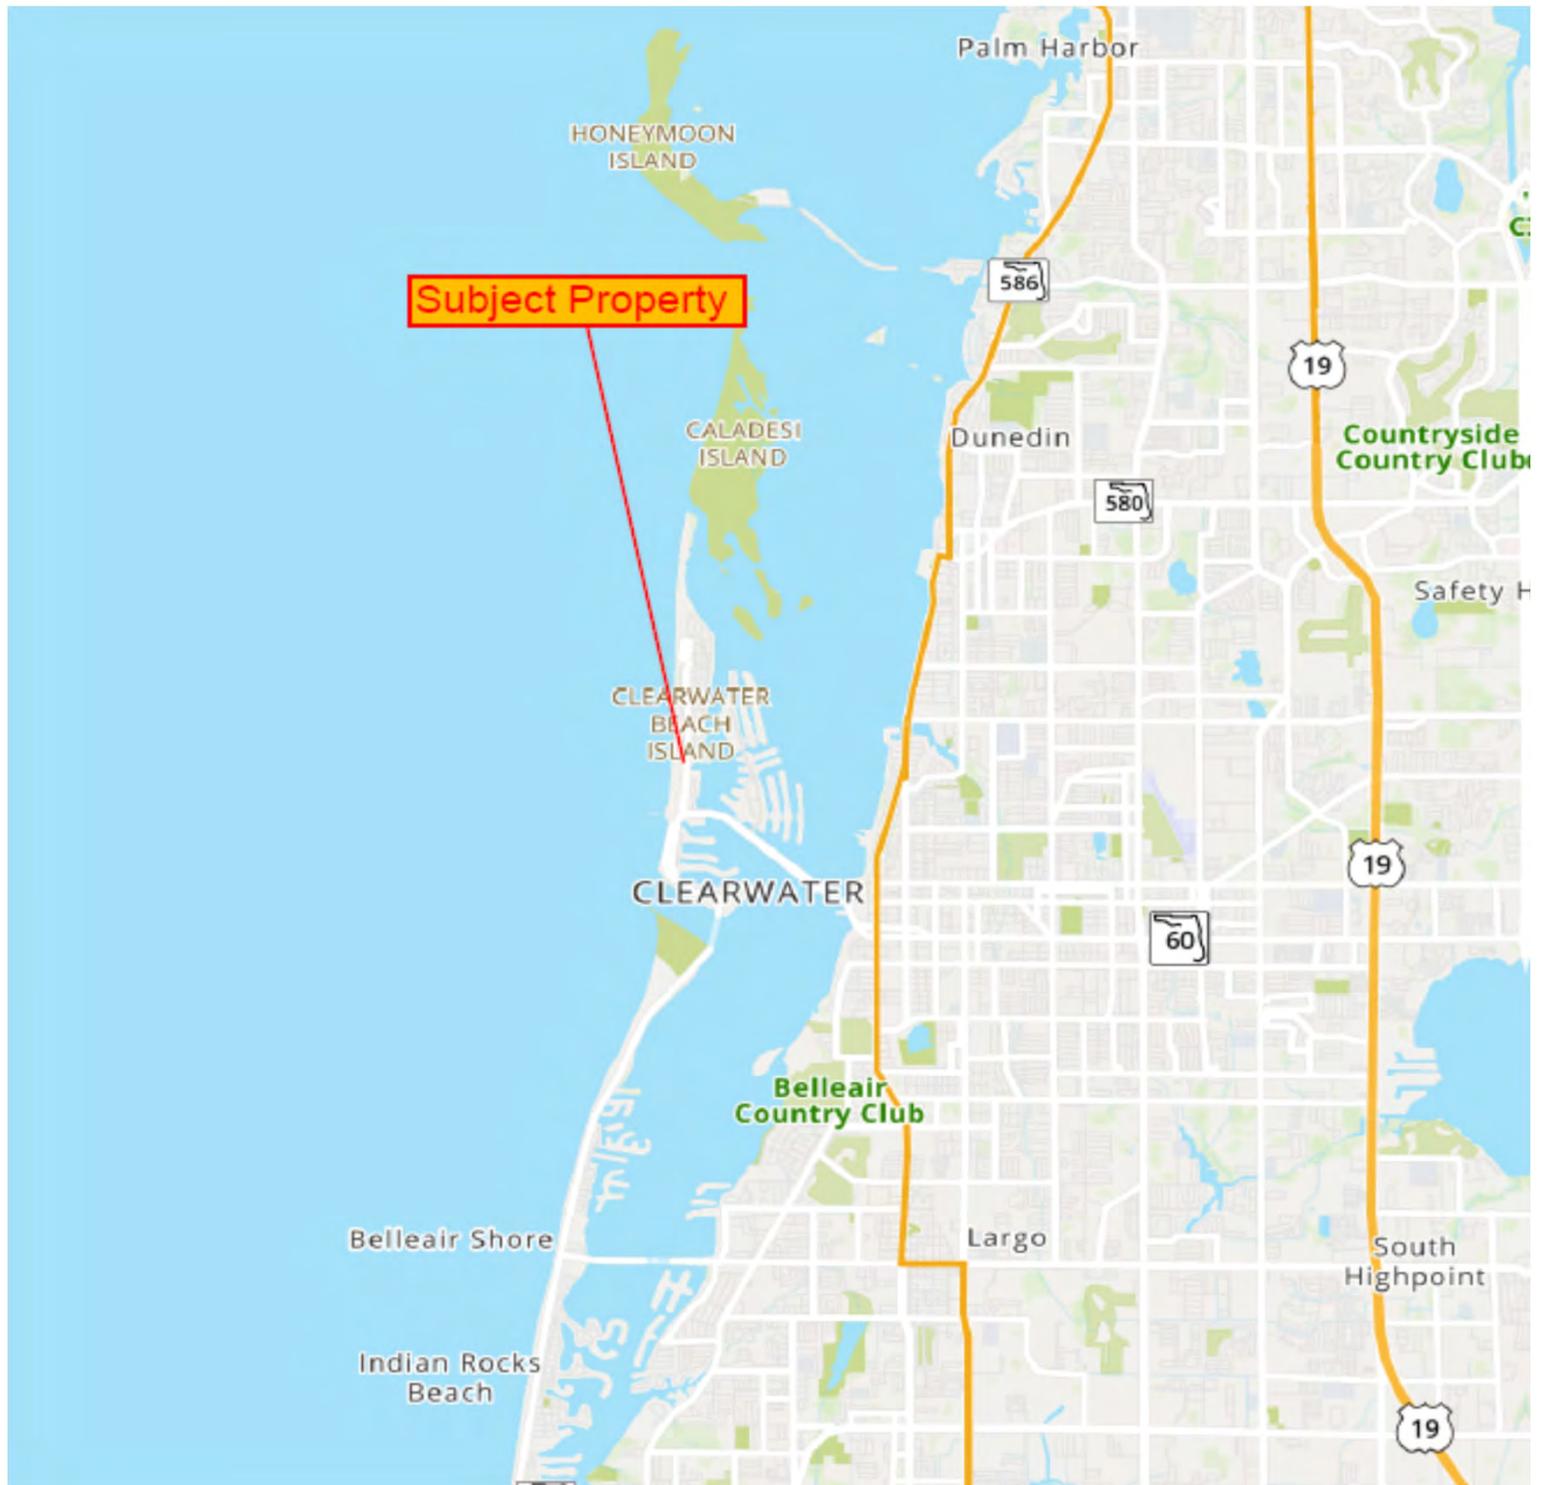

The analysis and recommendations submitted in this report are based upon the data obtained from the soil borings performed at the locations indicated. Regardless of the thoroughness of a geotechnical exploration, there is always a possibility that conditions between borings will be different from those at specific boring locations and that conditions will not be as anticipated by the designers or contractors. In addition, the construction process itself may alter soil conditions.

If any subsoil variations become evident during the course of this project, a re-evaluation of the recommendations contained in this report will be necessary after we have had an opportunity to observe the characteristics of the conditions encountered. The applicability of this report should also be reviewed in the event that significant changes occur in the design, nature or location of the proposed construction.

The recommendations provided herein are based in part upon project information provided to us and they apply only to the specific project and site discussed in this report. Once complete project information is available, the proposed facility structure characteristics should be conveyed to us for review. Our recommendations may then be modified, if necessary. Experienced geotechnical personnel should observe and document the construction procedures used and the conditions encountered. Unanticipated conditions and inadequate procedures should be reported to the design team. We recommend that the owner retain **GCTL** to provide these services based upon our familiarity with the project, the subsurface conditions, and the intent of the recommendations and design criteria.

Survey Area Data: Version 16, Sep 17, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Dec 17, 2013—Feb 28, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
16	Matlacha and St. Augustine soils and Urban land	0.5	100.0%
<b>Totals for Area of Interest</b>		<b>0.5</b>	<b>100.0%</b>

NOTES

1. MOBILIZED END BEARING IS 1/3 OF THE ORIGINAL RB-121 VALUES.
2. DAVISSON PILE CAPACITY IS AN ESTIMATE BASED ON FAILURE CRITERIA, AND EQUALS ULTIMATE SIDE FRICTION PLUS MOBILIZED END BEARING.
3. ALLOWABLE PILE CAPACITY IS 1/2 THE DAVISSON PILE CAPACITY.
4. ULTIMATE PILE CAPACITY IS ULTIMATE SIDE FRICTION PLUS 3 x THE MOBILIZED END BEARING.  
 EXCEPTION: FOR H-PILES TIPPED IN SAND OR LIMESTONE, THE ULTIMATE PILE CAPACITY IS ULTIMATE SIDE FRICTION PLUS 2 x THE MOBILIZED END BEARING.

DRS  
Timber Piles 8-inch Diameter

-----  
Program Options  
-----

Engineering units are US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes pile response to lateral loading and will compute nonlinear moment-curvature and nominal moment capacity for section types with nonlinear properties.

Computation Options:

- Analysis does not use p-y multipliers (individual pile or shaft only)
- Analysis assumes no shear resistance at pile tip
- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix values
- Report pile response for full length of pile
- Analysis assumes no loading by soil movements acting on pile
- No p-y curves to be computed and reported for user-specified depths

Solution Control Parameters:

- Number of pile increments = 100
- Maximum number of iterations allowed = 100
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 100.0000 in

Pile Response Output Options:

- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

-----  
Pile Structural Properties and Geometry  
-----

- Total number of pile sections = 1
- Total length of pile = 18.00 ft
- Depth of ground surface below top of pile = 1.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	8.0000000
2	18.000000	8.0000000

Input Structural Properties:

-----

Pile Section No. 1:

Section Type	=	Drilled Shaft (Bored Pile)
Section Length	=	18.00000000 ft
Section Diameter	=	8.00000000 in

-----  
Ground Slope and Pile Batter Angles  
-----

Ground Slope Angle	=	0.000 degrees
	=	0.000 radians
Pile Batter Angle	=	0.000 degrees
	=	0.000 radians

-----  
Soil and Rock Layering Information  
-----

The soil profile is modelled using 7 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	1.00000 ft
Distance from top of pile to bottom of layer	=	8.00000 ft
Effective unit weight at top of layer	=	118.00000 pcf
Effective unit weight at bottom of layer	=	118.00000 pcf
Friction angle at top of layer	=	34.00000 deg.
Friction angle at bottom of layer	=	34.00000 deg.
Subgrade k at top of layer	=	0.00000 pci
Subgrade k at bottom of layer	=	0.00000 pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	8.00000	ft
Distance from top of pile to bottom of layer	=	15.00000	ft
Effective unit weight at top of layer	=	118.00000	pcf
Effective unit weight at bottom of layer	=	118.00000	pcf
Friction angle at top of layer	=	33.00000	deg.
Friction angle at bottom of layer	=	33.00000	deg.
Subgrade k at top of layer	=	0.0000	pci
Subgrade k at bottom of layer	=	0.0000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	15.00000	ft
Distance from top of pile to bottom of layer	=	17.00000	ft
Effective unit weight at top of layer	=	115.00000	pcf
Effective unit weight at bottom of layer	=	115.00000	pcf
Friction angle at top of layer	=	30.00000	deg.
Friction angle at bottom of layer	=	30.00000	deg.
Subgrade k at top of layer	=	0.0000	pci
Subgrade k at bottom of layer	=	0.0000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	17.00000	ft
Distance from top of pile to bottom of layer	=	30.00000	ft
Effective unit weight at top of layer	=	118.00000	pcf
Effective unit weight at bottom of layer	=	118.00000	pcf
Friction angle at top of layer	=	33.00000	deg.
Friction angle at bottom of layer	=	33.00000	deg.
Subgrade k at top of layer	=	0.0000	pci
Subgrade k at bottom of layer	=	0.0000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 5 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	30.00000	ft
Distance from top of pile to bottom of layer	=	35.00000	ft
Effective unit weight at top of layer	=	115.00000	pcf
Effective unit weight at bottom of layer	=	115.00000	pcf
Friction angle at top of layer	=	32.00000	deg.
Friction angle at bottom of layer	=	32.00000	deg.
Subgrade k at top of layer	=	0.00000	pci
Subgrade k at bottom of layer	=	0.00000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 6 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	35.00000	ft
Distance from top of pile to bottom of layer	=	40.00000	ft
Effective unit weight at top of layer	=	110.00000	pcf
Effective unit weight at bottom of layer	=	110.00000	pcf
Friction angle at top of layer	=	28.00000	deg.
Friction angle at bottom of layer	=	28.00000	deg.
Subgrade k at top of layer	=	0.00000	pci
Subgrade k at bottom of layer	=	0.00000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 7 is weak rock, p-y criteria by Reese, 1997

Distance from top of pile to top of layer	=	40.00000	ft
Distance from top of pile to bottom of layer	=	53.00000	ft
Effective unit weight at top of layer	=	130.00000	pcf
Effective unit weight at bottom of layer	=	130.00000	pcf
Uniaxial compressive strength at top of layer	=	500.00000	psi
Uniaxial compressive strength at bottom of layer	=	500.00000	psi
Initial modulus of rock at top of layer	=	100.00000	psi
Initial modulus of rock at bottom of layer	=	100.00000	psi
RQD of rock at top of layer	=	10.00000	%
RQD of rock at bottom of layer	=	0.00000	%
k <sub>rm</sub> of rock at top of layer	=	0.00500	
k <sub>rm</sub> of rock at bottom of layer	=	0.00500	

(Depth of lowest soil layer extends 35.00 ft below pile tip)

-----  
 Loading Type  
 -----

Static loading criteria were used when computing p-y curves for all analyses.

-----  
 Pile-head Loading and Pile-head Fixity Conditions  
 -----

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	1	V = 400.00000 lbs	M = 0.0000 in-lbs	40000.	Yes
2	1	V = 600.00000 lbs	M = 0.0000 in-lbs	40000.	Yes
3	1	V = 800.00000 lbs	M = 0.0000 in-lbs	40000.	Yes
4	1	V = 1000.00000 lbs	M = 0.0000 in-lbs	40000.	Yes

V = perpendicular shear force applied to pile head

M = bending moment applied to pile head

y = lateral deflection relative to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applie to pile head

Axial thrust is assumed to be acting axially for all pile batter angles.

-----  
 Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness  
 -----

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:  
 -----

Dimensions and Properties of Drilled Shaft (Bored Pile):  
 -----

Length of Section	=	18.00000000 ft
Shaft Diameter	=	8.00000000 in
Concrete Cover Thickness	=	3.00000000 in
Number of Reinforcing Bars	=	1 bar
Yield Stress of Reinforcing Bars	=	1.50000000 ksi
Modulus of Elasticity of Reinforcing Bars	=	1500.00000000 ksi
Gross Area of Shaft	=	50.26548246 sq. in.
Total Area of Reinforcing Steel	=	0.31000000 sq. in.
Area Ratio of Steel Reinforcement	=	0.62 percent
Edge-to-Edge Bar Spacing	=	-0.62500000 in
Maximum Concrete Aggregate Size	=	0.10000000 in
Ratio of Bar Spacing to Aggregate Size	=	-6.25
Offset of Rebar Cage Center from Center of Pile	=	0.00000000 in

Axial Structural Capacities:

-----

Nom. Axial Structural Capacity =  $0.85 F_c A_c + F_y A_s$  = 51.420 kips  
 Tensile Load for Cracking of Concrete = -11.759 kips  
 Nominal Axial Tensile Capacity = -0.465 kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
1	0.62500	0.31000	0.00000	0.00000

NOTE: The positions of the above rebars were computed by LPILE

Concrete Properties:

-----

Compressive Strength of Concrete = 1.20000000 ksi  
 Modulus of Elasticity of Concrete = 1974.53792063 ksi  
 Modulus of Rupture of Concrete = -0.25980762 ksi  
 Compression Strain at Peak Stress = 0.00103315  
 Tensile Strain at Fracture of Concrete = -0.00011866  
 Maximum Coarse Aggregate Size = 0.10000000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
1	40.000

Definitions of Run Messages and Notes:

-----

- C = concrete in section has cracked in tension.
- Y = stress in reinforcing steel has reached yield stress.
- T = ACI 318-08 criteria for tension-controlled section met, tensile strain in reinforcement exceeds 0.005 while simultaneously compressive strain in concrete more than 0.003. See ACI 318-08, Section 10.3.4.
- Z = depth of tensile zone in concrete section is less than 10 percent of section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.  
 Position of neutral axis is measured from edge of compression side of pile.  
 Compressive stresses and strains are positive in sign.  
 Tensile stresses and strains are negative in sign.

Axial Thrust Force = 40.000 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in2	Depth to N Axis in	Max Comp Strain in/in	Max Tens Strain in/in	Max Concrete Stress ksi	Max Steel Stress ksi	Run Msg

-----  
 Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1  
 -----

Moment values interpolated at maximum compressive strain = 0.003  
 or maximum developed moment if pile fails at smaller strains.

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip	Max. Comp. Strain
1	40.000	41.849	0.00300000

Note note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318-08, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318-08, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

Axial Load No.	Resistance Factor for Moment	Nominal Moment Capacity in-kip	Ultimate (Factored) Axial Thrust kips	Ultimate (Factored) Moment Capacity in-kip	Bending Stiffness at Ult. Mom. Cap. kip-in <sup>2</sup>
1	0.65	41.849	26.000	27.202	252733.190
1	0.70	41.849	28.000	29.294	249073.365
1	0.75	41.849	30.000	31.387	244753.287

-----  
 Computed Values of Pile Loading and Deflection  
 for Lateral Loading for Load Case Number 1  
 -----

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head = 400.000 lbs  
 Applied moment at pile head = 0.000 in-lbs  
 Axial thrust load on pile head = 40000.000 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 1:

Pile-head deflection = 0.0802728 inches  
 Computed slope at pile head = -0.0021839 radians  
 Maximum bending moment = 12273. inch-lbs  
 Maximum shear force = 400.0000000 lbs  
 Depth of maximum bending moment = 34.5600000 inches below pile head  
 Depth of maximum shear force = 2.1600000 inches below pile head  
 Number of iterations = 6  
 Number of zero deflection points = 3

-----  
 Pile-head Deflection vs. Pile Length for Load Case 1  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 400. lbs  
 Moment = 0. in-lbs  
 Axial Load = 40000. lbs

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 2:

Pile-head deflection = 0.1228829 inches  
 Computed slope at pile head = -0.0033418 radians  
 Maximum bending moment = 18616. inch-lbs  
 Maximum shear force = 600.0000000 lbs  
 Depth of maximum bending moment = 34.5600000 inches below pile head  
 Depth of maximum shear force = 10.8000000 inches below pile head  
 Number of iterations = 6  
 Number of zero deflection points = 3

-----  
 Pile-head Deflection vs. Pile Length for Load Case 2  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 600. lbs  
 Moment = 0. in-lbs  
 Axial Load = 40000. lbs

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 3:

Pile-head deflection = 0.1724918 inches  
 Computed slope at pile head = -0.0046695 radians  
 Maximum bending moment = 25583. inch-lbs  
 Maximum shear force = 800.0000000 lbs  
 Depth of maximum bending moment = 34.5600000 inches below pile head  
 Depth of maximum shear force = 10.8000000 inches below pile head  
 Number of iterations = 7  
 Number of zero deflection points = 3

-----  
 Pile-head Deflection vs. Pile Length for Load Case 3  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 800. lbs  
 Moment = 0. in-lbs  
 Axial Load = 40000. lbs

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 4:

Pile-head deflection = 0.2381790 inches  
 Computed slope at pile head = -0.0063720 radians  
 Maximum bending moment = 33566. inch-lbs  
 Maximum shear force = 1000.0000000 lbs  
 Depth of maximum bending moment = 36.7200000 inches below pile head  
 Depth of maximum shear force = 2.1600000 inches below pile head  
 Number of iterations = 11  
 Number of zero deflection points = 3

-----  
 Pile-head Deflection vs. Pile Length for Load Case 4

Timber Piles 10-inch Diameter

-----  
Program Options  
-----

Engineering units are US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes pile response to lateral loading and will compute nonlinear moment-curvature and nominal moment capacity for section types with nonlinear properties.

Computation Options:

- Analysis does not use p-y multipliers (individual pile or shaft only)
- Analysis assumes no shear resistance at pile tip
- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix values
- Report pile response for full length of pile
- Analysis assumes no loading by soil movements acting on pile
- No p-y curves to be computed and reported for user-specified depths

Solution Control Parameters:

- Number of pile increments = 100
- Maximum number of iterations allowed = 100
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 100.0000 in

Pile Response Output Options:

- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

-----  
Pile Structural Properties and Geometry  
-----

- Total number of pile sections = 1
- Total length of pile = 18.00 ft
- Depth of ground surface below top of pile = 1.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	10.0000000
2	18.000000	10.0000000

-----  
Soil and Rock Layering Information  
-----

The soil profile is modelled using 7 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	1.00000 ft
Distance from top of pile to bottom of layer	=	8.00000 ft
Effective unit weight at top of layer	=	118.00000 pcf
Effective unit weight at bottom of layer	=	118.00000 pcf
Friction angle at top of layer	=	34.00000 deg.
Friction angle at bottom of layer	=	34.00000 deg.
Subgrade k at top of layer	=	0.00000 pci
Subgrade k at bottom of layer	=	0.00000 pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	8.00000	ft
Distance from top of pile to bottom of layer	=	15.00000	ft
Effective unit weight at top of layer	=	118.00000	pcf
Effective unit weight at bottom of layer	=	118.00000	pcf
Friction angle at top of layer	=	33.00000	deg.
Friction angle at bottom of layer	=	33.00000	deg.
Subgrade k at top of layer	=	0.0000	pci
Subgrade k at bottom of layer	=	0.0000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	15.00000	ft
Distance from top of pile to bottom of layer	=	17.00000	ft
Effective unit weight at top of layer	=	115.00000	pcf
Effective unit weight at bottom of layer	=	115.00000	pcf
Friction angle at top of layer	=	30.00000	deg.
Friction angle at bottom of layer	=	30.00000	deg.
Subgrade k at top of layer	=	0.0000	pci
Subgrade k at bottom of layer	=	0.0000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	17.00000	ft
Distance from top of pile to bottom of layer	=	30.00000	ft
Effective unit weight at top of layer	=	118.00000	pcf
Effective unit weight at bottom of layer	=	118.00000	pcf
Friction angle at top of layer	=	33.00000	deg.
Friction angle at bottom of layer	=	33.00000	deg.
Subgrade k at top of layer	=	0.0000	pci
Subgrade k at bottom of layer	=	0.0000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 5 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	30.00000	ft
Distance from top of pile to bottom of layer	=	35.00000	ft
Effective unit weight at top of layer	=	115.00000	pcf
Effective unit weight at bottom of layer	=	115.00000	pcf
Friction angle at top of layer	=	32.00000	deg.
Friction angle at bottom of layer	=	32.00000	deg.
Subgrade k at top of layer	=	0.00000	pci
Subgrade k at bottom of layer	=	0.00000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 6 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	35.00000	ft
Distance from top of pile to bottom of layer	=	40.00000	ft
Effective unit weight at top of layer	=	110.00000	pcf
Effective unit weight at bottom of layer	=	110.00000	pcf
Friction angle at top of layer	=	28.00000	deg.
Friction angle at bottom of layer	=	28.00000	deg.
Subgrade k at top of layer	=	0.00000	pci
Subgrade k at bottom of layer	=	0.00000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 7 is weak rock, p-y criteria by Reese, 1997

Distance from top of pile to top of layer	=	40.00000	ft
Distance from top of pile to bottom of layer	=	53.00000	ft
Effective unit weight at top of layer	=	130.00000	pcf
Effective unit weight at bottom of layer	=	130.00000	pcf
Uniaxial compressive strength at top of layer	=	500.00000	psi
Uniaxial compressive strength at bottom of layer	=	500.00000	psi
Initial modulus of rock at top of layer	=	100.00000	psi
Initial modulus of rock at bottom of layer	=	100.00000	psi
RQD of rock at top of layer	=	10.00000	%
RQD of rock at bottom of layer	=	0.00000	%
k <sub>rm</sub> of rock at top of layer	=	0.00500	
k <sub>rm</sub> of rock at bottom of layer	=	0.00500	

(Depth of lowest soil layer extends 35.00 ft below pile tip)

-----  
 Loading Type  
 -----

Static loading criteria were used when computing p-y curves for all analyses.

-----  
 Pile-head Loading and Pile-head Fixity Conditions  
 -----

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	1	V = 1500.00000 lbs	M = 0.0000 in-lbs	50000.	Yes
2	1	V = 2000.00000 lbs	M = 0.0000 in-lbs	50000.	Yes
3	1	V = 2200.00000 lbs	M = 0.0000 in-lbs	50000.	Yes
4	1	V = 2400.00000 lbs	M = 0.0000 in-lbs	50000.	Yes

V = perpendicular shear force applied to pile head

M = bending moment applied to pile head

y = lateral deflection relative to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Axial thrust is assumed to be acting axially for all pile batter angles.

-----  
 Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness  
 -----

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

File Section No. 1:  
-----

Dimensions and Properties of Drilled Shaft (Bored Pile):  
-----

Length of Section = 18.00000000 ft  
Shaft Diameter = 10.00000000 in  
Concrete Cover Thickness = 3.00000000 in  
Number of Reinforcing Bars = 1 bar  
Yield Stress of Reinforcing Bars = 1.50000000 ksi  
Modulus of Elasticity of Reinforcing Bars = 1500.00000000 ksi  
Gross Area of Shaft = 78.53981634 sq. in.  
Total Area of Reinforcing Steel = 0.44000000 sq. in.  
Area Ratio of Steel Reinforcement = 0.56 percent  
Edge-to-Edge Bar Spacing = -0.75000000 in  
Maximum Concrete Aggregate Size = 0.10000000 in  
Ratio of Bar Spacing to Aggregate Size = -7.50  
Offset of Rebar Cage Center from Center of Pile = 0.00000000 in

Axial Structural Capacities:  
-----

Nom. Axial Structural Capacity =  $0.85 F_c A_c + F_y A_s$  = 80.322 kips  
Tensile Load for Cracking of Concrete = -18.376 kips  
Nominal Axial Tensile Capacity = -0.660 kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
1	0.75000	0.44000	0.00000	0.00000

NOTE: The positions of the above rebars were computed by LPILE

Concrete Properties:  
-----

Compressive Strength of Concrete = 1.20000000 ksi  
Modulus of Elasticity of Concrete = 1974.53792063 ksi  
Modulus of Rupture of Concrete = -0.25980762 ksi  
Compression Strain at Peak Stress = 0.00103315  
Tensile Strain at Fracture of Concrete = -0.00011866  
Maximum Coarse Aggregate Size = 0.10000000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
-----	-----
1	50.000

Definitions of Run Messages and Notes:

- 
- C = concrete in section has cracked in tension.
  - Y = stress in reinforcing steel has reached yield stress.
  - T = ACI 318-08 criteria for tension-controlled section met, tensile strain in reinforcement exceeds 0.005 while simultaneously compressive strain in concrete more than than 0.003. See ACI 318-08, Section 10.3.4.
  - Z = depth of tensile zone in concrete section is less than 10 percent of section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.  
 Position of neutral axis is measured from edge of compression side of pile.  
 Compressive stresses and strains are positive in sign.  
 Tensile stresses and strains are negative in sign.

Axial Thrust Force = 50.000 kips

-----  
Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1  
-----

Moment values interpolated at maximum compressive strain = 0.003  
or maximum developed moment if pile fails at smaller strains.

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip	Max. Comp. Strain
1	50.000	93.981	0.00300000

Note note that the values of moment capacity in the table above are not factored by a strength reduction factor ( $\phi$ -factor).

In ACI 318-08, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318-08, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

Axial Load No.	Resistance Factor for Moment	Nominal Moment Capacity in-kip	Ultimate (Factored) Axial Thrust kips	Ultimate (Factored) Moment Capacity in-kip	Bending Stiffness at Ult. Mom. Cap. kip-in <sup>2</sup>
1	0.65	93.981	32.500	61.088	747368.345
1	0.70	93.981	35.000	65.787	740792.825
1	0.75	93.981	37.500	70.486	732997.823

-----  
 Computed Values of Pile Loading and Deflection  
 for Lateral Loading for Load Case Number 1  
 -----

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head = 1500.000 lbs  
 Applied moment at pile head = 0.000 in-lbs  
 Axial thrust load on pile head = 50000.000 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in <sup>2</sup>	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 1:

Pile-head deflection = 0.1689111 inches  
 Computed slope at pile head = -0.0038077 radians  
 Maximum bending moment = 50097. inch-lbs  
 Maximum shear force = 1500.0000000 lbs  
 Depth of maximum bending moment = 41.0400000 inches below pile head  
 Depth of maximum shear force = 4.3200000 inches below pile head  
 Number of iterations = 6  
 Number of zero deflection points = 3

-----  
 Pile-head Deflection vs. Pile Length for Load Case 1  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 1500. lbs  
 Moment = 0. in-lbs  
 Axial Load = 50000. lbs

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 2:

Pile-head deflection = 0.2429594 inches  
 Computed slope at pile head = -0.0054166 radians  
 Maximum bending moment = 69781. inch-lbs  
 Maximum shear force = 2000.0000000 lbs  
 Depth of maximum bending moment = 41.0400000 inches below pile head  
 Depth of maximum shear force = 2.1600000 inches below pile head  
 Number of iterations = 9  
 Number of zero deflection points = 3

-----  
 Pile-head Deflection vs. Pile Length for Load Case 2  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 2000. lbs  
 Moment = 0. in-lbs  
 Axial Load = 50000. lbs

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic

sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 3:

Pile-head deflection = 0.2910867 inches  
 Computed slope at pile head = -0.0064610 radians  
 Maximum bending moment = 78792. inch-lbs  
 Maximum shear force = 2200.0000000 lbs  
 Depth of maximum bending moment = 43.2000000 inches below pile head  
 Depth of maximum shear force = 10.8000000 inches below pile head  
 Number of iterations = 16  
 Number of zero deflection points = 3

-----  
 Pile-head Deflection vs. Pile Length for Load Case 3  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 2200. lbs  
 Moment = 0. in-lbs  
 Axial Load = 50000. lbs

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 4:

Pile-head deflection = 0.3650112 inches  
 Computed slope at pile head = -0.0080724 radians  
 Maximum bending moment = 88504. inch-lbs  
 Maximum shear force = 2400.0000000 lbs  
 Depth of maximum bending moment = 43.2000000 inches below pile head  
 Depth of maximum shear force = 10.8000000 inches below pile head  
 Number of iterations = 32  
 Number of zero deflection points = 3

-----  
 Pile-head Deflection vs. Pile Length for Load Case 4  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 2400. lbs  
 Moment = 0. in-lbs  
 Axial Load = 50000. lbs

File Length feet	Pile Head Deflection inches	Maximum Moment ln-lbs	Maximum Shear lbs

Timber Piles 12-inch Diameter

-----  
Program Options  
-----

Engineering units are US Customary Units: pounds, inches, feet

Basic Program Options:

This analysis computes pile response to lateral loading and will compute nonlinear moment-curvature and nominal moment capacity for section types with nonlinear properties.

Computation Options:

- Analysis does not use p-y multipliers (individual pile or shaft only)
- Analysis assumes no shear resistance at pile tip
- Analysis for fixed-length pile or shaft only
- No computation of foundation stiffness matrix values
- Report pile response for full length of pile
- Analysis assumes no loading by soil movements acting on pile
- No p-y curves to be computed and reported for user-specified depths

Solution Control Parameters:

- Number of pile increments = 100
- Maximum number of iterations allowed = 100
- Deflection tolerance for convergence = 1.0000E-05 in
- Maximum allowable deflection = 100.0000 in

Pile Response Output Options:

- Values of pile-head deflection, bending moment, shear force, and soil reaction are printed for full length of pile.
- Printing Increment (nodal spacing of output points) = 1

-----  
Pile Structural Properties and Geometry  
-----

- Total number of pile sections = 1
- Total length of pile = 18.00 ft
- Depth of ground surface below top of pile = 1.00 ft

Pile diameter values used for p-y curve computations are defined using 2 points.

p-y curves are computed using pile diameter values interpolated with depth over the length of the pile.

Point	Depth X ft	Pile Diameter in
1	0.00000	12.0000000
2	18.000000	12.0000000

Input Structural Properties:

-----  
Pile Section No. 1:

Section Type	=	Drilled Shaft (Bored Pile)
Section Length	=	18.00000000 ft
Section Diameter	=	12.00000000 in

-----  
Ground Slope and Pile Batter Angles  
-----

Ground Slope Angle	=	0.000 degrees
	=	0.000 radians
Pile Batter Angle	=	0.000 degrees
	=	0.000 radians

-----  
Soil and Rock Layering Information  
-----

The soil profile is modelled using 7 layers

Layer 1 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	1.00000 ft
Distance from top of pile to bottom of layer	=	8.00000 ft
Effective unit weight at top of layer	=	118.00000 pcf
Effective unit weight at bottom of layer	=	118.00000 pcf
Friction angle at top of layer	=	34.00000 deg.
Friction angle at bottom of layer	=	34.00000 deg.
Subgrade k at top of layer	=	0.00000 pci
Subgrade k at bottom of layer	=	0.00000 pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 2 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	8.00000	ft
Distance from top of pile to bottom of layer	=	15.00000	ft
Effective unit weight at top of layer	=	118.00000	pcf
Effective unit weight at bottom of layer	=	118.00000	pcf
Friction angle at top of layer	=	33.00000	deg.
Friction angle at bottom of layer	=	33.00000	deg.
Subgrade k at top of layer	=	0.0000	pci
Subgrade k at bottom of layer	=	0.0000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 3 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	15.00000	ft
Distance from top of pile to bottom of layer	=	17.00000	ft
Effective unit weight at top of layer	=	115.00000	pcf
Effective unit weight at bottom of layer	=	115.00000	pcf
Friction angle at top of layer	=	30.00000	deg.
Friction angle at bottom of layer	=	30.00000	deg.
Subgrade k at top of layer	=	0.0000	pci
Subgrade k at bottom of layer	=	0.0000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 4 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	17.00000	ft
Distance from top of pile to bottom of layer	=	30.00000	ft
Effective unit weight at top of layer	=	118.00000	pcf
Effective unit weight at bottom of layer	=	118.00000	pcf
Friction angle at top of layer	=	33.00000	deg.
Friction angle at bottom of layer	=	33.00000	deg.
Subgrade k at top of layer	=	0.0000	pci
Subgrade k at bottom of layer	=	0.0000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 5 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	30.00000	ft
Distance from top of pile to bottom of layer	=	35.00000	ft
Effective unit weight at top of layer	=	115.00000	pcf
Effective unit weight at bottom of layer	=	115.00000	pcf
Friction angle at top of layer	=	32.00000	deg.
Friction angle at bottom of layer	=	32.00000	deg.
Subgrade k at top of layer	=	0.00000	pci
Subgrade k at bottom of layer	=	0.00000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 6 is sand, p-y criteria by Reese et al., 1974

Distance from top of pile to top of layer	=	35.00000	ft
Distance from top of pile to bottom of layer	=	40.00000	ft
Effective unit weight at top of layer	=	110.00000	pcf
Effective unit weight at bottom of layer	=	110.00000	pcf
Friction angle at top of layer	=	28.00000	deg.
Friction angle at bottom of layer	=	28.00000	deg.
Subgrade k at top of layer	=	0.00000	pci
Subgrade k at bottom of layer	=	0.00000	pci

NOTE: Internal default values for subgrade k will be computed for the above soil layer.

Layer 7 is weak rock, p-y criteria by Reese, 1997

Distance from top of pile to top of layer	=	40.00000	ft
Distance from top of pile to bottom of layer	=	53.00000	ft
Effective unit weight at top of layer	=	130.00000	pcf
Effective unit weight at bottom of layer	=	130.00000	pcf
Uniaxial compressive strength at top of layer	=	500.00000	psi
Uniaxial compressive strength at bottom of layer	=	500.00000	psi
Initial modulus of rock at top of layer	=	100.00000	psi
Initial modulus of rock at bottom of layer	=	100.00000	psi
RQD of rock at top of layer	=	10.00000	%
RQD of rock at bottom of layer	=	0.00000	%
k <sub>rm</sub> of rock at top of layer	=	0.00500	
k <sub>rm</sub> of rock at bottom of layer	=	0.00500	

(Depth of lowest soil layer extends 35.00 ft below pile tip)

-----  
 Loading Type  
 -----

Static loading criteria were used when computing p-y curves for all analyses.

-----  
 Pile-head Loading and Pile-head Fixity Conditions  
 -----

Number of loads specified = 4

Load No.	Load Type	Condition 1	Condition 2	Axial Thrust Force, lbs	Compute Top y vs. Pile Length
1	1	V = 3000.00000 lbs	M = 0.0000 in-lbs	60000.	Yes
2	1	V = 3500.00000 lbs	M = 0.0000 in-lbs	60000.	Yes
3	1	V = 3800.00000 lbs	M = 0.0000 in-lbs	60000.	Yes
4	1	V = 4000.00000 lbs	M = 0.0000 in-lbs	60000.	Yes

V = perpendicular shear force applied to pile head

M = bending moment applied to pile head

y = lateral deflection relative to pile axis

S = pile slope relative to original pile batter angle

R = rotational stiffness applied to pile head

Axial thrust is assumed to be acting axially for all pile batter angles.

-----  
 Computations of Nominal Moment Capacity and Nonlinear Bending Stiffness  
 -----

Axial thrust force values were determined from pile-head loading conditions

Number of Pile Sections Analyzed = 1

Pile Section No. 1:  
 -----

Dimensions and Properties of Drilled Shaft (Bored Pile):  
 -----

Length of Section	=	18.00000000	ft
Shaft Diameter	=	12.00000000	in
Concrete Cover Thickness	=	3.00000000	in
Number of Reinforcing Bars	=	1	bar
Yield Stress of Reinforcing Bars	=	1.50000000	ksi
Modulus of Elasticity of Reinforcing Bars	=	1500.00000000	ksi
Gross Area of Shaft	=	113.09733553	sq. in.
Total Area of Reinforcing Steel	=	0.60000000	sq. in.
Area Ratio of Steel Reinforcement	=	0.53	percent
Edge-to-Edge Bar Spacing	=	-0.87500000	in
Maximum Concrete Aggregate Size	=	0.10000000	in
Ratio of Bar Spacing to Aggregate Size	=	-8.75	
Offset of Rebar Cage Center from Center of Pile	=	0.00000000	in

Axial Structural Capacities:  
 -----

Nom. Axial Structural Capacity = $0.85 F_c A_c + F_y A_s$	=	115.647	kips
Tensile Load for Cracking of Concrete	=	-26.464	kips
Nominal Axial Tensile Capacity	=	-0.900	kips

Reinforcing Bar Dimensions and Positions Used in Computations:

Bar Number	Bar Diam. inches	Bar Area sq. in.	X inches	Y inches
-----	-----	-----	-----	-----
1	0.87500	0.60000	0.00000	0.00000

NOTE: The positions of the above rebars were computed by LPile

Concrete Properties:

-----

Compressive Strength of Concrete	=	1.20000000 ksi
Modulus of Elasticity of Concrete	=	1974.53792063 ksi
Modulus of Rupture of Concrete	=	-0.25980762 ksi
Compression Strain at Peak Stress	=	0.00103315
Tensile Strain at Fracture of Concrete	=	-0.00011866
Maximum Coarse Aggregate Size	=	0.10000000 in

Number of Axial Thrust Force Values Determined from Pile-head Loadings = 1

Number	Axial Thrust Force kips
-----	-----
1	60.000

Definitions of Run Messages and Notes:

-----

- C = concrete in section has cracked in tension.
- Y = stress in reinforcing steel has reached yield stress.
- T = ACI 318-08 criteria for tension-controlled section met, tensile strain in reinforcement exceeds 0.005 while simultaneously compressive strain in concrete more than than 0.003. See ACI 318-08, Section 10.3.4.
- Z = depth of tensile zone in concrete section is less than 10 percent of section depth.

Bending Stiffness (EI) = Computed Bending Moment / Curvature.  
Position of neutral axis is measured from edge of compression side of pile.  
Compressive stresses and strains are positive in sign.  
Tensile stresses and strains are negative in sign.

Axial Thrust Force = 60.000 kips

Bending Curvature rad/in.	Bending Moment in-kip	Bending Stiffness kip-in2	Depth to N Axis in	Max Comp Strain in/in	Max Tens Strain in/in	Max Concrete Stress ksi	Max Steel Stress ksi	Run Msg

-----  
 Summary of Results for Nominal (Unfactored) Moment Capacity for Section 1  
 -----

Moment values interpolated at maximum compressive strain = 0.003  
 or maximum developed moment if pile fails at smaller strains.

Load No.	Axial Thrust kips	Nominal Mom. Cap. in-kip	Max. Comp. Strain
1	60.000	163.582	0.00300000

Note note that the values of moment capacity in the table above are not factored by a strength reduction factor (phi-factor).

In ACI 318-08, the value of the strength reduction factor depends on whether the transverse reinforcing steel bars are tied hoops (0.65) or spirals (0.70).

The above values should be multiplied by the appropriate strength reduction factor to compute ultimate moment capacity according to ACI 318-08, Section 9.3.2.2 or the value required by the design standard being followed.

The following table presents factored moment capacities and corresponding bending stiffnesses computed for common resistance factor values used for reinforced concrete sections.

Axial Load No.	Resistance Factor for Moment	Nominal Moment Capacity in-kip	Ultimate (Factored) Axial Thrust kips	Ultimate (Factored) Moment Capacity in-kip	Bending Stiffness at Ult. Mom. Cap. kip-in <sup>2</sup>
1	0.65	163.582	39.000	106.328	1710517.333
1	0.70	163.582	42.000	114.508	1574863.796
1	0.75	163.582	45.000	122.687	1494103.166

-----  
 Computed Values of Pile Loading and Deflection  
 for Lateral Loading for Load Case Number 1  
 -----

Pile-head conditions are Shear and Moment (Loading Type 1)

Shear force at pile head = 3000.000 lbs  
 Applied moment at pile head = 0.000 in-lbs  
 Axial thrust load on pile head = 60000.000 lbs

Depth X feet	Deflect. y inches	Bending Moment in-lbs	Shear Force lbs	Slope S radians	Total Stress psi*	Bending Stiffness lb-in^2	Soil Res. p lb/in	Soil Spr. Es*h lb/inch	Distrib. Lat. Load lb/inch

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic

sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 1:

Pile-head deflection = 0.2232613 inches  
 Computed slope at pile head = -0.0043388 radians  
 Maximum bending moment = 110098. inch-lbs  
 Maximum shear force = 3000.0000000 lbs  
 Depth of maximum bending moment = 47.5200000 inches below pile head  
 Depth of maximum shear force = 10.8000000 inches below pile head  
 Number of iterations = 7  
 Number of zero deflection points = 2

-----  
 Pile-head Deflection vs. Pile Length for Load Case 1  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 3000. lbs  
 Moment = 0. in-lbs  
 Axial Load = 60000. lbs

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic

sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 2:

Pile-head deflection = 0.2907164 inches  
 Computed slope at pile head = -0.0056592 radians  
 Maximum bending moment = 132239. inch-lbs  
 Maximum shear force = 3500.0000001 lbs  
 Depth of maximum bending moment = 47.5200000 inches below pile head  
 Depth of maximum shear force = 2.1600000 inches below pile head  
 Number of iterations = 16  
 Number of zero deflection points = 2

-----  
 Pile-head Deflection vs. Pile Length for Load Case 2  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 3500. lbs  
 Moment = 0. in-lbs  
 Axial Load = 60000. lbs

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 3:

Pile-head deflection = 0.3513423 inches  
 Computed slope at pile head = -0.0068423 radians  
 Maximum bending moment = 146656. inch-lbs  
 Maximum shear force = 3800.0000001 lbs  
 Depth of maximum bending moment = 47.5200000 inches below pile head  
 Depth of maximum shear force = 2.1600000 inches below pile head  
 Number of iterations = 24  
 Number of zero deflection points = 2

-----  
 Pile-head Deflection vs. Pile Length for Load Case 3  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 3800. lbs  
 Moment = 0. in-lbs  
 Axial Load = 60000. lbs

\* This analysis makes computations of pile response using nonlinear moment-curvature relationships.

The above values of total stress are computed for combined axial and bending stress in elastic sections and do not equal actual stresses in concrete and steel in the range of nonlinear bending.

Output Summary for Load Case No. 4:

Pile-head deflection = 0.4167975 inches  
 Computed slope at pile head = -0.0081500 radians  
 Maximum bending moment = 156953. inch-lbs  
 Maximum shear force = 4000.0000001 lbs  
 Depth of maximum bending moment = 47.5200000 inches below pile head  
 Depth of maximum shear force = 2.1600000 inches below pile head  
 Number of iterations = 44  
 Number of zero deflection points = 2

-----  
 Pile-head Deflection vs. Pile Length for Load Case 4  
 -----

Boundary Condition Type 1, Shear and Moment

Shear = 4000. lbs  
 Moment = 0. in-lbs  
 Axial Load = 60000. lbs

File Length feet	Pile Head Deflection inches	Maximum Moment ln-lbs	Maximum Shear lbs

-----  
 Summary of Pile Response(s)  
 -----

Definitions of Pile-head Loading Conditions:

- Load Type 1: Load 1 = Shear, lbs, and Load 2 = Moment, in-lbs  
 Load Type 2: Load 1 = Shear, lbs, and Load 2 = Slope, radians  
 Load Type 3: Load 1 = Shear, lbs, and Load 2 = Rotational Stiffness, in-lbs/radian  
 Load Type 4: Load 1 = Top Deflection, inches, and Load 2 = Moment, in-lbs  
 Load Type 5: Load 1 = Top Deflection, inches, and Load 2 = Slope, radians

Load Case No.	Load Type No.	Pile-head Condition 1 V(lbs) or y(inches)	Pile-head Condition 2 in-lb, rad., or in-lb/rad.	Axial Loading lbs	Pile-head Deflection inches	Maximum Moment in Pile in-lbs	Maximum Shear in Pile lbs	Pile-head Rotation radians
1	1	V = 3000.0000	M = 0.000	60000.	0.22326131	110098.	3000.0000	-0.00433881
2	1	V = 3500.0000	M = 0.000	60000.	0.29071644	132239.	3500.0000	-0.00565925
3	1	V = 3800.0000	M = 0.000	60000.	0.35134227	146656.	3800.0000	-0.00684228
4	1	V = 4000.0000	M = 0.000	60000.	0.41679746	156953.	4000.0000	-0.00815000
